Isolated Singularities of Polyharmonic Inequalities

Marius Ghergu^{*}, Amir Moradifam[†] and Steven D. Taliaferro^{‡§}

Abstract

We study nonnegative classical solutions u of the polyharmonic inequality

 $-\Delta^m u \geq 0$ in $B_1(0) - \{0\} \subset \mathbb{R}^n$.

We give necessary and sufficient conditions on integers $n \geq 2$ and $m \geq 1$ such that these solutions u satisfy a pointwise a priori bound as $x \to 0$. In this case we show that the optimal bound for u is

 $u(x) = O(\Gamma(x))$ as $x \to 0$

where Γ is the fundamental solution of $-\Delta$ in \mathbb{R}^n .

Keywords: Polyharmonic inequality, isolated singularity. 2010 Mathematics Subject Classification Codes: 35B09, 35B40, 35B45, 35C15, 35G05, 35R45.

1 Introduction

It is easy to show that there does not exist a pointwise a priori bound as $x \to 0$ for C^2 nonnegative solutions $u(x)$ of

$$
-\Delta u \ge 0 \quad \text{in} \quad B_1(0) - \{0\} \subset \mathbb{R}^n, \quad n \ge 2. \tag{1.1}
$$

That is, given any continuous function $\psi: (0,1) \to (0,\infty)$ there exists a C^2 nonnegative solution $u(x)$ of (1.1) such that

 $u(x) \neq O(\psi(|x|))$ as $x \to 0$.

The same is true if the inequality in [\(1.1\)](#page-0-0) is reversed.

In this paper we study C^{2m} nonnegative solutions of the polyharmonic inequality

$$
-\Delta^m u \ge 0 \quad \text{in} \quad B_1(0) - \{0\} \subset \mathbb{R}^n \tag{1.2}
$$

where $n \geq 2$ and $m \geq 1$ are integers. We obtain the following result.

Theorem 1.1. A necessary and sufficient condition on integers $n \geq 2$ and $m \geq 1$ such that C^{2m} nonnegative solutions $u(x)$ of [\(1.2\)](#page-0-1) satisfy a pointwise a priori bound as $x \to 0$ is that

either m is even or n
$$
< 2m
$$
.
$$

In this case, the optimal bound for u is

$$
u(x) = O(\Gamma_0(x)) \quad as \quad x \to 0,
$$
\n(1.4)

where

$$
\Gamma_0(x) = \begin{cases} |x|^{2-n} & \text{if } n \ge 3\\ \log \frac{5}{|x|} & \text{if } n = 2. \end{cases}
$$
\n(1.5)

The m-Kelvin transform of a function $u(x)$, $x \in \Omega \subset \mathbb{R}^n - \{0\}$, is defined by

$$
v(y) = |x|^{n-2m}u(x) \quad \text{where} \quad x = y/|y|^2. \tag{1.6}
$$

By direct computation, $v(y)$ satisfies

$$
\Delta^m v(y) = |x|^{n+2m} \Delta^m u(x). \tag{1.7}
$$

See [\[15,](#page-17-0) p. 221] or [\[16,](#page-17-1) p. 660]. This fact and Theorem [1.1](#page-0-2) immediately imply the following result.

Theorem 1.2. A necessary and sufficient condition on integers $n \geq 2$ and $m \geq 1$ such that C^{2m} nonnegative solutions $v(y)$ of

$$
-\Delta^m v \ge 0 \quad in \quad \mathbb{R}^n - B_1(0)
$$

satisfy a pointwise a priori bound as $|y| \to \infty$ is that [\(1.3\)](#page-0-3) holds. In this case, the optimal bound for v is

$$
v(y) = O(\Gamma_{\infty}(y)) \quad \text{as} \quad |y| \to \infty \tag{1.8}
$$

where

$$
\Gamma_{\infty}(y) = \begin{cases} |y|^{2m-2} & \text{if } n \ge 3\\ |y|^{2m-2} \log(5|y|) & \text{if } n = 2. \end{cases}
$$
\n(1.9)

The estimates [\(1.4\)](#page-1-0) and [\(1.8\)](#page-1-1) are optimal because $\Delta^m\Gamma_0 = 0 = \Delta^m\Gamma_\infty$ in $\mathbb{R}^n - \{0\}.$

The sufficiency of condition [\(1.3\)](#page-0-3) in Theorem [1.1](#page-0-2) and the estimate [\(1.4\)](#page-1-0) are an immediate consequence of the following theorem, which gives for C^{2m} nonnegative solutions u of [\(1.2\)](#page-0-1) one sided estimates for $\Delta^{\sigma} u$, $\sigma = 0, 1, 2, ..., m$, and estimates for $|D^{\beta} u|$ for certain multi-indices β .

Theorem 1.3. Let $u(x)$ be a C^{2m} nonnegative solution of

$$
-\Delta^m u \ge 0 \quad \text{in} \quad B_2(0) - \{0\} \subset \mathbb{R}^n, \tag{1.10}
$$

where $n \geq 2$ and $m \geq 1$ are integers. Then for each nonnegative integer $\sigma \leq m$ we have

$$
(-1)^{m+\sigma} \Delta^{\sigma} u(x) \le C \left| \frac{d^{2\sigma}}{d|x|^{2\sigma}} \Gamma_0(|x|) \right| \quad \text{for} \quad 0 < |x| < 1 \tag{1.11}
$$

where Γ_0 is given by [\(1.5\)](#page-1-2) and C is a positive constant independent of x.

Moreover, if $n < 2m$ and β is a multi-index then

$$
|D^{\beta}u(x)| = O\left(\left|\frac{d^{|\beta|}}{d|x|^{|\beta|}}\Gamma_0(|x|)\right|\right) \quad \text{as} \quad x \to 0 \tag{1.12}
$$

for

$$
|\beta| \le \begin{cases} 2m-n & \text{if } n \text{ is odd} \\ 2m-n-1 & \text{if } n \text{ is even.} \end{cases}
$$
 (1.13)

There is a similar result when the singularity is at infinity.

Theorem 1.4. Let $v(y)$ be a C^{2m} nonnegative solution of

$$
-\Delta^m v \ge 0 \quad in \quad \mathbb{R}^n - B_{1/2}(0),\tag{1.14}
$$

where $n \geq 2$ and $m \geq 1$ are integers. Then for each nonnegative integer $\sigma \leq m$ we have

$$
(-1)^{m+\sigma} \Delta^{\sigma}(|y|^{2\sigma-2m} v(y)) \le C \begin{cases} |y|^{-2} \log 5|y| & \text{if } \sigma = 0 \text{ and } n = 2 \\ |y|^{-2} & \text{if } \sigma \ge 1 \text{ or } n \ge 3 \end{cases} \quad \text{for} \quad |y| > 1 \tag{1.15}
$$

where C is a positive constant independent of y .

Moreover, if $n < 2m$ and β is a multi-index satisfying [\(1.13\)](#page-1-3) then

$$
|D^{\beta}v(y)| = O\left(\left|\frac{d^{|\beta|}}{d|y|^{|\beta|}}\Gamma_{\infty}(|y|)\right|\right) \quad \text{as} \quad |y| \to \infty \tag{1.16}
$$

where Γ_{∞} is given by [\(1.9\)](#page-1-4).

Note that in Theorems [1.3](#page-1-5) and [1.4](#page-2-0) we do not require that m and n satisfy (1.3) .

Inequality [\(1.15\)](#page-2-1) gives one sided estimates for $\Delta^{\sigma}(|y|^{2\sigma-2m}v(y))$. Sometimes one sided estimates for $\Delta^{\sigma}v$ also hold. For example, in the important case $m = 2$, $n = 2$ or 3, and the singularity is at the infinity, we have the following corollary of Theorem [1.4.](#page-2-0)

Corollary 1.1. Let $v(y)$ be a $C⁴$ nonnegative solution of

$$
-\Delta^2 v \ge 0 \quad in \quad \mathbb{R}^n - B_{1/2}(0)
$$

where $n = 2$ or 3. Then

$$
v(y) = O(\Gamma_{\infty}(|y|)) \quad \text{and} \quad |\nabla v(y)| = O\left(\left|\frac{d}{d|y|}\Gamma_{\infty}(|y|)\right|\right) \quad \text{as} \quad |y| \to \infty \tag{1.17}
$$

and

$$
-\Delta v(y) < C \left| \frac{d^2}{d|y|^2} \Gamma_\infty(|y|) \right| \quad \text{for} \quad |y| > 1 \tag{1.18}
$$

where Γ_{∞} is given by [\(1.9\)](#page-1-4) and C is a positive constant independent of y.

The proof of Theorem [1.3](#page-1-5) relies heavily on a representation formula for C^{2m} nonnegative solutions u of (1.2) , which we state and prove in Section [3.](#page-6-0) This formula, which is valid for all integers $n \geq 2$ and $m \geq 1$ and which when $m = 1$ is essentially a result of Brezis and Lions [\[2\]](#page-16-0), may also be useful for studying nonnegative solutions in a punctured neighborhood of the origin—or near $x = \infty$ via the *m*-Kelvin transform—of problems of the form

$$
-\Delta^m u = f(x, u) \quad \text{or} \quad 0 \le -\Delta^m u \le f(x, u) \tag{1.19}
$$

when f is a nonnegative function and m and n may or may not satisfy (1.3) . Examples of such problems can be found in [\[4,](#page-17-2) [5,](#page-17-3) [9,](#page-17-4) [11,](#page-17-5) [12,](#page-17-6) [15,](#page-17-0) [16\]](#page-17-1) and elsewhere.

Pointwise estimates at $x = \infty$ of solutions u of problems [\(1.19\)](#page-2-2) can be crucial for proving existence results for entire solutions of [\(1.19\)](#page-2-2) which in turn can be used to obtain, via scaling methods, existence and estimates of solutions of boundary value problems associated with [\(1.19\)](#page-2-2), see e.g. [\[13,](#page-17-7) [14\]](#page-17-8). An excellent reference for polyharmonic boundary value problems is [\[8\]](#page-17-9).

Lastly, weak solutions of $\Delta^m u = \mu$, where μ is a measure on a subset of \mathbb{R}^n , have been studied in [\[3\]](#page-16-1) and [\[6\]](#page-17-10), and removable isolated singularities of $\Delta^m u = 0$ have been studied in [\[11\]](#page-17-5).

2 Preliminary results

In this section we state and prove four lemmas. Lemmas [2.1,](#page-3-0) [2.2,](#page-3-1) and [2.3](#page-4-0) will only be used to prove Lemma [2.4,](#page-4-1) which in turn will be used in Section [3](#page-6-0) to prove Theorem [3.1.](#page-6-1)

Lemmas [2.1](#page-3-0) and [2.2](#page-3-1) are well-known. We include their very short proofs for the convenience of the reader.

Lemma 2.1. Let $f : (0, r_2] \to [0, \infty)$ be a continuous function where r_2 is a finite positive constant. Suppose $n \geq 2$ is an integer and the equation

$$
v'' + \frac{n-1}{r}v' = -f(r) \qquad 0 < r < r_2 \tag{2.1}
$$

has a nonnegative solution $v(r)$. Then

$$
\int_0^{r_2} r^{n-1} f(r) \, dr < \infty. \tag{2.2}
$$

Proof. Let $r_1 = r_2/2$. Integrating [\(2.1\)](#page-3-2) we obtain

$$
r^{n-1}v'(r) = r_1^{n-1}v'(r_1) + \int_r^{r_1} \rho^{n-1}f(\rho) d\rho \quad \text{for} \quad 0 < r < r_1. \tag{2.3}
$$

Suppose for contradiction that

$$
r_1^{n-1}v'(r_1) + \int_{r_0}^{r_1} \rho^{n-1} f(\rho) d\rho \ge 1 \quad \text{for some} \quad r_0 \in (0, r_1).
$$

Then for $0 < r < r_0$ we have by (2.3) that

$$
v(r_0) - v(r) \ge \int_r^{r_0} \rho^{1-n} d\rho \to \infty \quad \text{as} \quad r \to 0^+
$$

which contradicts the nonnegativity of $v(r)$.

Lemma 2.2. Suppose $f : (0, R] \to \mathbb{R}$ is a continuous function, $n \geq 2$ is an integer, and

$$
\int_0^R \rho^{n-1} |f(\rho)| d\rho < \infty. \tag{2.4}
$$

Define $u_0: (0, R] \to \mathbb{R}$ by

$$
u_0(r) = \begin{cases} \frac{1}{n-2} \left[\frac{1}{r^{n-2}} \int_0^r \rho^{n-1} f(\rho) d\rho + \int_r^R \rho f(\rho) d\rho \right] & \text{if } n \ge 3\\ \left(\log \frac{2R}{r} \right) \int_0^r \rho f(\rho) d\rho + \int_r^R \rho \left(\log \frac{2R}{\rho} \right) f(\rho) d\rho & \text{if } n = 2. \end{cases}
$$

Then $u = u_0(r)$ is a C^2 solution of

$$
-(\Delta u)(r) := -\left(u''(r) + \frac{n-1}{r}u'(r)\right) = f(r) \quad \text{for} \quad 0 < r \le R. \tag{2.5}
$$

Moreover, all solutions $u(r)$ of (2.5) are such that

$$
\int_0^r \rho^{n-1} |u(\rho)| d\rho = \begin{cases} O(r^2) & \text{as } r \to 0^+ \text{ if } n \ge 3 \\ O\left(r^2 \log \frac{1}{r}\right) & \text{as } r \to 0^+ \text{ if } n = 2. \end{cases}
$$
 (2.6)

Proof. By [\(2.4\)](#page-3-5) the formula for $u_0(r)$ makes sense and it is easy to check that $u = u_0(r)$ is a solution of [\(2.5\)](#page-3-4) and, as $r \rightarrow 0^+,$

$$
u_0(r) = \begin{cases} O(r^{2-n}) & \text{if } n \ge 3\\ O\left(\log \frac{1}{r}\right) & \text{if } n = 2. \end{cases}
$$

Thus, since all solutions of [\(2.5\)](#page-3-4) are given by

$$
u = u_0(r) + C_1 + C_2 \begin{cases} r^{2-n} & \text{if } n \ge 3 \\ \log \frac{1}{r} & \text{if } n = 2 \end{cases}
$$

where C_1 and C_2 are arbitrary constants, we see that all solutions of (2.5) satisfy (2.6) . \Box

Lemma 2.3. Suppose $f : (0, R] \to \mathbb{R}$ is a continuous function, $n \geq 2$ is an integer, and

$$
\int_{x \in B_R(0) \subset \mathbb{R}^n} |f(|x|)| dx < \infty. \tag{2.7}
$$

If $u = u(|x|)$ is a radial solution of

$$
-\Delta^m u = f \quad \text{for} \quad 0 < |x| \le R, \quad m \ge 1 \tag{2.8}
$$

then

$$
\int_{|x|
$$

Proof. The lemma is true for $m = 1$ by Lemma [2.2.](#page-3-1) Assume, inductively, that the lemma is true for $m-1$ where $m \geq 2$. Let u be a radial solution of [\(2.8\)](#page-4-2). Then

$$
-\Delta(\Delta^{m-1}u) = -\Delta^m u = f \quad \text{for} \quad 0 < |x| \le R.
$$

Hence by [\(2.7\)](#page-4-3) and Lemma [2.2,](#page-3-1)

$$
g := -\Delta^{m-1} u \in L^1(B_R(0)).
$$

So by the inductive assumption, [\(2.9\)](#page-4-4) holds.

Lemma 2.4. Suppose $f: \overline{B_R(0)} - \{0\} \to \mathbb{R}$ is a nonnegative continuous function and u is a C^{2m} solution of

$$
\begin{array}{c}\n-\Delta^m u = f \\
u \ge 0\n\end{array}\n\Big\}\n\quad in \quad\n\overline{B_R(0)} - \{0\} \subset \mathbb{R}^n, \quad n \ge 2, \quad m \ge 1.
$$
\n(2.10)

Then

$$
\int_{|x|< r} u(x) dx = \begin{cases} O(r^2) & \text{as } r \to 0^+ \text{ if } n \ge 3\\ O\left(r^2 \log \frac{1}{r}\right) & \text{as } r \to 0^+ \text{ if } n = 2 \end{cases} \tag{2.11}
$$

and

$$
\int_{|x|
$$

Proof. By averaging [\(2.10\)](#page-4-5) we can assume $f = f(|x|)$ and $u = u(|x|)$ are radial functions. The lemma is true for $m = 1$ by Lemmas [2.1](#page-3-0) and [2.2.](#page-3-1) Assume inductively that the lemma is true for $m-1$, where $m \geq 2$. Let $u = u(|x|)$ be a radial solution of [\(2.10\)](#page-4-5). Let $v = \Delta^{m-1}u$. Then $-\Delta v = -\Delta^m u = f$ and integrating this equation we obtain as in the proof of Lemma [2.1](#page-3-0) that

$$
r^{n-1}v'(r) = r_2^{n-1}v'(r_2) + \int_r^{r_2} \rho^{n-1}f(\rho) d\rho \quad \text{for all} \quad 0 < r < r_2 \le R. \tag{2.13}
$$

We can assume

$$
\int_0^R \rho^{n-1} f(\rho) d\rho = \infty \tag{2.14}
$$

for otherwise \int $|x|< R$ $f(x) dx < \infty$ and hence [\(2.12\)](#page-4-6) obviously holds and [\(2.11\)](#page-4-7) holds by Lemma [2.3.](#page-4-0) By [\(2.13\)](#page-5-0) and [\(2.14\)](#page-5-1) we have for some $r_1 \in (0, R)$ that

$$
v'(r_1) \ge 1. \tag{2.15}
$$

Replacing r_2 with r_1 in [\(2.13\)](#page-5-0) we get

$$
v'(\rho) = \frac{r_1^{n-1}v'(r_1)}{\rho^{n-1}} + \frac{1}{\rho^{n-1}} \int_{\rho}^{r_1} s^{n-1} f(s) \, ds \quad \text{for} \quad 0 < \rho \le r_1
$$

and integrating this equation from r to r_1 we obtain for $0 < r \leq r_1$ that

$$
-v(r) = -v(r_1) + r_1^{n-1}v'(r_1)\int_r^{r_1} \frac{1}{\rho^{n-1}} d\rho + \int_r^{r_1} \frac{1}{\rho^{n-1}} \int_\rho^{r_1} s^{n-1} f(s) ds d\rho
$$

and hence by [\(2.15\)](#page-5-2) for some $r_0 \in (0, r_1)$ we have

$$
-\Delta^{m-1}u(r) = -v(r) > \int_r^{r_0} \frac{1}{\rho^{n-1}} \int_{\rho}^{r_0} s^{n-1} f(s) \, ds \, d\rho \ge 0 \quad \text{for} \quad 0 < r \le r_0.
$$

So by the inductive assumption, u satisfies (2.11) and

$$
\infty > \frac{1}{n\omega_n} \int_{|x| < r_0} |x|^{2m-4} (-v(|x|)) dx
$$
\n
$$
= \int_0^{r_0} r^{2m+n-5} (-v(r)) dr
$$
\n
$$
\geq \int_0^{r_0} r^{2m+n-5} \left(\int_r^{r_0} \frac{1}{\rho^{n-1}} \int_\rho^{r_0} s^{n-1} f(s) ds d\rho \right) dr
$$
\n
$$
= C \int_0^{r_0} s^{2m-2} f(s) s^{n-1} ds
$$
\n
$$
= C \int_{|x| < r_0} |x|^{2m-2} f(x) dx
$$

where in the above calculation we have interchanged the order of integration and C is a positive \Box constant which depends only on m and n . This completes the inductive proof.

3 Representation formula

A fundamental solution of Δ^m in \mathbb{R}^n , where $n \geq 2$ and $m \geq 1$ are integers, is given by

$$
\int (-1)^{m} |x|^{2m-n}, \qquad \text{if } 2 \le 2m < n \tag{3.1}
$$

$$
\Phi(x) := a \begin{cases} (-1)^{\frac{n-1}{2}} |x|^{2m-n}, & \text{if } 3 \le n < 2m \text{ and } n \text{ is odd} \\ (-1)^{\frac{n}{2}} |x|^{2m-n} \log \frac{5}{1-\alpha}, & \text{if } 2 \le n \le 2m \text{ and } n \text{ is even} \end{cases}
$$
(3.3)

$$
\left((-1)^{\frac{n}{2}} |x|^{2m-n} \log \frac{\partial}{|x|}, \qquad \text{if } 2 \le n \le 2m \text{ and } n \text{ is even} \right) \tag{3.3}
$$

where $a = a(m, n)$ is a positive constant. In the sense of distributions, $\Delta^m \Phi = \delta$, where δ is the Dirac mass at the origin in \mathbb{R}^n . For $x \neq 0$ and $y \neq x$, let

$$
\Psi(x,y) = \Phi(x-y) - \sum_{|\alpha| \le 2m-3} \frac{(-y)^{\alpha}}{\alpha!} D^{\alpha} \Phi(x)
$$
\n(3.4)

be the error in approximating $\Phi(x - y)$ with the partial sum of degree $2m - 3$ of the Taylor series of Φ at x .

The following theorem gives representation formula [\(3.6\)](#page-6-2) for nonnegative solutions of inequality $(3.5).$ $(3.5).$

Theorem 3.1. Let $u(x)$ be a C^{2m} nonnegative solution of

$$
-\Delta^m u \ge 0 \quad in \quad B_2(0) - \{0\} \subset \mathbb{R}^n,
$$
\n
$$
(3.5)
$$

where $n \geq 2$ and $m \geq 1$ are integers. Then

$$
u = N + h + \sum_{|\alpha| \le 2m - 2} a_{\alpha} D^{\alpha} \Phi \quad in \quad B_1(0) - \{0\}
$$
 (3.6)

where a_{α} , $|\alpha| \leq 2m-2$, are constants, $h \in C^{\infty}(B_1(0))$ is a solution of

$$
\Delta^m h = 0 \quad in \quad B_1(0),
$$

and

$$
N(x) = \int_{|y| \le 1} \Psi(x, y) \Delta^m u(y) dy \quad \text{for} \quad x \ne 0. \tag{3.7}
$$

When $m = 1$, equation [\(3.6\)](#page-6-2) becomes

$$
u = N + h + a_0 \Phi_1
$$
 in $B_1(0) - \{0\},$

where

$$
N(x) = \int_{|y| < 1} \Phi_1(x - y) \Delta u(y) \, dy
$$

and Φ_1 is the fundamental solution of the Laplacian in \mathbb{R}^n . Thus, when $m = 1$, Theorem [3.1](#page-6-1) is essentially a result of Brezis and Lions [\[2\]](#page-16-0).

Futamura, Kishi, and Mizuta [\[6,](#page-17-10) Theorem 1] and [\[7,](#page-17-11) Corollary 5.1] obtained a result very similar to our Theorem [3.1,](#page-6-1) but using their result we would have to let the index of summation α in [\(3.4\)](#page-6-4) range over the larger set $|\alpha| \leq 2m - 2$. This would not suffice for our proof of Theorem [1.1.](#page-0-2) We have however used their idea of using the remainder term $\Psi(x, y)$ instead of $\Phi(x - y)$ in [\(3.7\)](#page-6-5). This is done so that the integral in [\(3.7\)](#page-6-5) is finite. See also the book [\[10,](#page-17-12) p. 137].

Proof of Theorem [3.1.](#page-6-1) By [\(3.5\)](#page-6-3),

$$
f := -\Delta^m u \ge 0 \quad \text{in} \quad B_2(0) - \{0\}. \tag{3.8}
$$

Thus by Lemma [2.4,](#page-4-1)

$$
\int_{|x| < 1} |x|^{2m-2} f(x) \, dx < \infty \tag{3.9}
$$

and

$$
\int_{|x|\n
$$
(3.10)
$$
$$

If $|\alpha| = 2m - 2$ we claim

$$
D^{\alpha}\Phi(x) = O(\Gamma_0(x)) \quad \text{as} \quad x \to 0 \tag{3.11}
$$

where $\Gamma_0(x)$ is given by [\(1.5\)](#page-1-2). This is clearly true if Φ is given by [\(3.1\)](#page-6-0) or [\(3.2\)](#page-6-0) because then $n \geq 3$ and $\Gamma_0(x) = |x|^{2-n}$. The estimate [\(3.11\)](#page-7-0) is also true when Φ is given by [\(3.3\)](#page-6-0) because then $|x|^{2m-n}$ is a polynomial of degree $2m - n \leq 2m - 2 = |\alpha|$ with equality if and only if $n = 2$, and hence $D^{\alpha} \Phi$ has a term with $\log \frac{5}{|x|}$ as a factor if and only if $n = 2$. This proves [\(3.11\)](#page-7-0).

By Taylor's theorem and [\(3.11\)](#page-7-0) we have

$$
|\Psi(x,y)| \le C|y|^{2m-2}\Gamma_0(x)
$$

\n
$$
\le C|y|^{2m-2}|x|^{2-n}\log\frac{5}{|x|} \quad \text{for} \quad |y| < \frac{|x|}{2} < 1.
$$
\n(3.12)

Differentiating (3.4) with respect to x we get

$$
D_x^{\beta}(\Psi(x,y)) = (D^{\beta}\Phi)(x-y) - \sum_{|\alpha| \le 2m-3} \frac{(-y)^{\alpha}}{\alpha!} (D^{\alpha+\beta}\Phi)(x) \quad \text{for} \quad x \ne 0 \quad \text{and} \quad y \ne x \tag{3.13}
$$

and so by Taylor's theorem applied to $D^{\beta}\Phi$ we have

$$
|D_x^{\beta}\Psi(x,y)| \le C|y|^{2m-2}|x|^{2-n-|\beta|}\log\frac{5}{|x|} \quad \text{for} \quad |y| < \frac{|x|}{2} < 1. \tag{3.14}
$$

Also,

$$
\Delta_x^m \Psi(x, y) = 0 = \Delta_y^m \Psi(x, y) \quad \text{for} \quad x \neq 0 \quad \text{and} \quad y \neq x \tag{3.15}
$$

(see also [\[10,](#page-17-12) Lemma 4.1, p. 137]) and

$$
\int_{|x| < r} |\Phi(x - y)| \, dx \le Cr^{2m} \log \frac{5}{r}
$$
\n
$$
\le C|y|^{2m - 2} r^2 \log \frac{5}{r} \quad \text{for} \quad 0 < r \le 2|y| < 2. \tag{3.16}
$$

Before continuing with the proof of Theorem [3.1,](#page-6-1) we state and prove the following lemma.

Lemma 3.1. For $|y| < 1$ and $0 < r < 1$ we have

$$
\int_{|x|
$$

Proof. Since $\Psi(x,0) \equiv 0$ for $x \neq 0$, we can assume $y \neq 0$.

Case I. Suppose $0 < r \leq |y| < 1$. Then by (3.16)

$$
\int_{0<|x|

$$
\leq C \left[|y|^{2m-2} r^2 \log \frac{5}{r} + \sum_{|\alpha| < 2m-3} |y|^{\alpha} |r^{2m-|\alpha|} \log \frac{5}{r} \right]
$$

$$
\leq C |y|^{2m-2} r^2 \log \frac{5}{r}.
$$
$$

Case II. Suppose $0 < |y| < r < 1$. Then by [\(3.16\)](#page-7-1), with $r = 2|y|$, and [\(3.12\)](#page-7-2) we have

$$
\int_{|x| < 2r} |\Psi(x, y)| \, dx = \int_{2|y| < |x| < 2r} |\Psi(x, y)| \, dx + \int_{|x| < 2|y|} |\Psi(x, y)| \, dx
$$
\n
$$
\leq C \left[\int_{2|y| < |x| < 2r} |y|^{2m-2} |x|^{2-n} \log \frac{5}{|x|} \, dx + |y|^{2m} \log \frac{5}{|y|} \right]
$$
\n
$$
+ \sum_{|\alpha| \leq 2m-3} |y|^{|\alpha|} \int_{|x| < 2|y|} |D^{\alpha} \Phi(x)| \, dx \right]
$$
\n
$$
\leq C \left[|y|^{2m-2} r^2 \log \frac{5}{r} + |y|^{2m-2} |y|^2 \log \frac{5}{|y|} \right]
$$
\n
$$
\leq C |y|^{2m-2} r^2 \log \frac{5}{r}
$$

which proves the lemma.

Continuing with the proof of Theorem [3.1,](#page-6-1) let N be defined by (3.7) and let $2r \in (0,1)$ be fixed. Then for $2r<|x|<1$ we have

$$
N(x) = \int_{r < |y| < 1} \left[\Phi(y - x) - \sum_{|\alpha| \le 2m - 3} \frac{(-y)^{\alpha}}{\alpha!} D^{\alpha} \Phi(x) \right] \Delta^m u(y) \, dy
$$
\n
$$
- \int_{0 < |y| < r} \Psi(x, y) f(y) \, dy.
$$

By (3.9) and (3.14) , we can move differentiation of the second integral with respect to x under the integral. Hence by [\(3.15\)](#page-7-5),

$$
\Delta^m N = \Delta^m u \tag{3.18}
$$

 \Box

for $2r < |x| < 1$ and since $2r \in (0, 1)$ was arbitrary, (3.18) holds for $0 < |x| < 1$.

By $(3.7), (3.8),$ $(3.7), (3.8),$ $(3.7), (3.8),$ and Lemma [3.1,](#page-7-7) for $0 < r < 1$ we have

$$
\int_{|x|< r} |N(x)| dx \le \int_{|y|<1} \left(\int_{|x|< r} |\Psi(x,y)| dx \right) f(y) dy
$$
\n
$$
\le Cr^2 \log \frac{5}{r} \int_{|y|<1} |y|^{2m-2} f(y) dy
$$
\n
$$
= O\left(r^2 \log \frac{1}{r}\right) \quad \text{as} \quad r \to 0^+
$$

by [\(3.9\)](#page-7-3). Thus by [\(3.10\)](#page-7-8)

$$
v := u - N \in L_{loc}^{1}(B_{1}(0)) \subset \mathcal{D}'(B_{1}(0))
$$
\n(3.19)

and

$$
\int_{|x|\n
$$
(3.20)
$$
$$

By [\(3.18\)](#page-8-0),

 $\Delta^m v(x) = 0$ for $0 < |x| < 1$.

Thus $\Delta^m v$ is a distribution in $\mathcal{D}'(B_1(0))$ whose support is a subset of $\{0\}$. Hence

$$
\Delta^m v = \sum_{|\alpha| \leq k} a_\alpha D^\alpha \delta
$$

is a finite linear combination of the delta function and its derivatives.

We now use a method of Brezis and Lions [\[2\]](#page-16-0) to show $a_{\alpha} = 0$ for $|\alpha| \geq 2m - 1$. Choose $\varphi \in C_0^{\infty}(B_1(0))$ such that

$$
(-1)^{|\alpha|}(D^{\alpha}\varphi)(0) = a_{\alpha} \quad \text{for} \quad |\alpha| \leq k.
$$

Let $\varphi_{\varepsilon}(x) = \varphi\left(\frac{x}{\varepsilon}\right)$ $(\frac{x}{\varepsilon})$. Then, for $0 < \varepsilon < 1$, $\varphi_{\varepsilon} \in C_0^{\infty}(B_1(0))$ and

$$
\int v\Delta^m \varphi_{\varepsilon} = (\Delta^m v)(\varphi_{\varepsilon}) = \sum_{|\alpha| \le k} a_{\alpha} (D^{\alpha} \delta) \varphi_{\varepsilon}
$$

=
$$
\sum_{|\alpha| \le k} a_{\alpha} (-1)^{|\alpha|} \delta(D^{\alpha} \varphi_{\varepsilon}) = \sum_{|\alpha| \le k} a_{\alpha} (-1)^{|\alpha|} (D^{\alpha} \varphi_{\varepsilon}) (0)
$$

=
$$
\sum_{|\alpha| \le k} a_{\alpha} (-1)^{|\alpha|} \frac{1}{\varepsilon^{|\alpha|}} (D^{\alpha} \varphi) (0) = \sum_{|\alpha| \le k} a_{\alpha}^2 \frac{1}{\varepsilon^{|\alpha|}}.
$$

On the other hand,

$$
\int v \Delta^m \varphi_{\varepsilon} = \int v(x) \frac{1}{\varepsilon^{2m}} (\Delta^m \varphi) \left(\frac{x}{\varepsilon}\right) dx
$$

$$
\leq \frac{C}{\varepsilon^{2m}} \int \limits_{|x| < \varepsilon} |v(x)| dx = O\left(\frac{1}{\varepsilon^{2m-2}} \log \frac{1}{\varepsilon}\right) \quad \text{as} \quad \varepsilon \to 0^+
$$

by [\(3.20\)](#page-9-0). Hence $a_{\alpha} = 0$ for $|\alpha| \geq 2m - 1$ and consequently

$$
\Delta^m v = \sum_{|\alpha| \le 2m-2} a_{\alpha} D^{\alpha} \delta = \sum_{|\alpha| \le 2m-2} a_{\alpha} D^{\alpha} \Delta^m \Phi.
$$

That is

$$
\Delta^m \left(v - \sum_{|\alpha| \le 2m-2} a_{\alpha} D^{\alpha} \Phi \right) = 0 \quad \text{in} \quad \mathcal{D}'(B_1(0)).
$$

Thus for some C^{∞} solution of $\Delta^{m} h = 0$ in $B_1(0)$ we have

$$
v = \sum_{|\alpha| \le 2m-2} a_{\alpha} D^{\alpha} \Phi + h \text{ in } B_1(0) - \{0\}.
$$

Hence Theorem [3.1](#page-6-1) follows from [\(3.19\)](#page-9-1).

4 Proofs of Theorems [1.3](#page-1-5) and [1.4](#page-2-0) and Corollary [1.1](#page-2-3)

In this section we prove Theorems [1.3](#page-1-5) and [1.4](#page-2-0) and Corollary [1.1.](#page-2-3)

Proof of Theorem [1.3.](#page-1-5) This proof is a continuation of the proof of Theorem [3.1.](#page-6-1) If $m = 1$ then Theorem [1.3](#page-1-5) is trivially true. Hence we can assume $m \geq 2$. Also, if $\sigma = m$ then [\(1.11\)](#page-1-6) follows trivially from [\(1.10\)](#page-1-7). Hence we can assume $\sigma \leq m - 1$ in [\(1.11\)](#page-1-6).

If α and β are multi-indices and $|\alpha| = 2m - 2$ then it follows from (3.1) – (3.3) that

$$
D^{\alpha+\beta}\Phi(x) = O\left(\left|\frac{d^{|\beta|}}{d|x|^{|\beta|}}\Gamma_0(|x|)\right|\right) \quad \text{as} \quad x \to 0. \tag{4.1}
$$

(This is clearly true if $n = 2$. If $n \geq 3$ then $|\alpha + \beta| = 2m - 2 + |\beta| > 2m - n$ and thus

$$
D^{\alpha+\beta}\Phi(x) = O(|x|^{2m-n-(2m-2+|\beta|)}) = O\left(\left|\frac{d^{|\beta|}}{d|x|^{|\beta|}}\Gamma_0(|x|)\right|\right).
$$

Let L^b be any linear partial differential operator of the form Σ $|\beta|=b$ $c_{\beta}D^{\beta}$, where *b* is a nonnegative integer and $c_{\beta} \in \mathbb{R}$. Then applying Taylor's theorem to [\(3.13\)](#page-7-9) and using [\(4.1\)](#page-10-0) we obtain

$$
|L_x^b \Psi(x, y)| \le C|y|^{2m-2} \left| \frac{d^b}{d|x|^b} \Gamma_0(|x|) \right| \quad \text{for} \quad |y| < \frac{|x|}{2} < 1. \tag{4.2}
$$

Here and later C is a positive constant, independent of x and y, whose value may change from line to line. For $0 \leq b \leq 2m-1$ we have

$$
L^{b}N(x) = \int_{|y| < 1} -L^{b}_{x} \Psi(x, y)f(y) \, dy \quad \text{for} \quad 0 < |x| < 1.
$$

Hence by (4.1) , (4.2) , (3.6) and (3.9) we have

$$
L^{b}u(x) \le C \left| \frac{d^{b}}{d|x|^{b}} \Gamma_{0}(|x|) \right| \quad \text{for} \quad 0 < |x| < 1 \tag{4.3}
$$

provided $0 \leq b \leq 2m-1$ and

$$
-L_x^b\Psi(x,y) \le C|y|^{2m-2} \left| \frac{d^b}{d|x|^b} \Gamma_0(|x|) \right| \quad \text{for} \quad 0 < \frac{|x|}{2} < |y| < 1. \tag{4.4}
$$

We will complete the proof of Theorem [1.3](#page-1-5) by proving (4.4) for various choices for L^b . For the rest of the proof of Theorem [1.3](#page-1-5) we will always assume

$$
0 < \frac{|x|}{2} < |y| < 1 \tag{4.5}
$$

which implies

$$
|x - y| \le |x| + |y| \le 3|y|. \tag{4.6}
$$

Case I. Suppose Φ is given by (3.1) or (3.2) . It follows from (3.13) and (4.5) that

$$
|D_x^{\beta}\Psi(x,y) - D_x^{\beta}\Phi(x-y)| \le C \sum_{|\alpha| \le 2m-3} |y|^{|\alpha|} |x|^{2m-n-|\alpha|-|\beta|}
$$

$$
\le C|y|^{2m-2}|x|^{2-n-|\beta|}.
$$

Thus [\(4.4\)](#page-10-2), and hence [\(4.3\)](#page-10-3), holds provided $0 \le b \le 2m - 1$ and

$$
-(L^{b}\Phi)(x-y) \le C|y|^{2m-2}|x|^{2-n-b}.
$$
\n(4.7)

Case I(a). Suppose Φ is given by [\(3.1\)](#page-6-0). Let $\sigma \in [0, m-1]$ be an integer, $b = 2\sigma$, and $L^b =$ $(-1)^{m+\sigma}\Delta^{\sigma}$. Then $0 \leq b \leq 2m-2$ and

$$
sgn(-L^b\Phi) = (-1)^{1+m+\sigma} sgn \Delta^{\sigma}\Phi = (-1)^{1+2m+\sigma} sgn \Delta^{\sigma}|x|^{2m-n} = (-1)^{1+2m+2\sigma} = -1.
$$

Thus [\(4.7\)](#page-11-1), and hence [\(4.3\)](#page-10-3) holds with $L^b = (-1)^{m+\sigma} \Delta^{\sigma}$ and $0 \le \sigma \le m-1$. This completes the proof of Theorem [1.3](#page-1-5) when Φ is given by [\(3.1\)](#page-6-0).

Case I(b). Suppose Φ is given by [\(3.2\)](#page-6-0). Then *n* is odd. It follows from [\(4.5\)](#page-11-0) and [\(4.6\)](#page-11-2) that for $0 \leq |\beta| \leq 2m - n$ we have

$$
|(D^{\beta}\Phi)(x-y)| \le C|x-y|^{2m-n-|\beta|} \le C|y|^{2m-n-|\beta|} \le C|y|^{2m-2}|x|^{2-n-|\beta|}.
$$

So [\(4.7\)](#page-11-1) holds with $L^b = \pm D^{\beta}$ and $|\beta| = b$. Hence

$$
|D^{\beta}u(x)| \le C|x|^{2-n-|\beta|} \quad \text{for} \quad 0 \le |\beta| \le 2m-n \quad \text{and} \quad 0 < |x| < 1.
$$

In particular

$$
|\Delta^{\sigma}u(x)| \le C|x|^{2-n-2\sigma} \quad \text{for} \quad 2\sigma \le 2m-n \quad \text{and} \quad 0<|x|<1.
$$

Also, if $2m - n + 1 \leq 2\sigma \leq 2m - 2$, $b = 2\sigma$, and $L^b = (-1)^{m+\sigma} \Delta^{\sigma}$, then $0 \leq \sigma \leq m-1$ and

$$
sgn(-L^b\Phi) = (-1)^{m+\sigma+1} sgn \Delta^{\sigma}\Phi = (-1)^{m+\sigma+1+\frac{n-1}{2}} sgn \Delta^{\sigma}|x|^{2m-n}
$$

= $(-1)^{m+\sigma+1+\frac{n-1}{2}} sgn(\Delta^{\frac{b-(2m-n+1)}{2}} \Delta^{\frac{2m-n+1}{2}} |x|^{2m-n})$
= $(-1)^{m+\sigma+1+\frac{n-1}{2}+\sigma-m+\frac{n-1}{2}} = -1$

because $\Delta^{\frac{2m-n+1}{2}}|x|^{2m-n} = C|x|^{-1}$ where $C > 0$.

So [\(4.7\)](#page-11-1) holds with $L^b = (-1)^{m+\sigma} \Delta^{\sigma}$. Hence $(-1)^{m+\sigma} \Delta^{\sigma} u(x) \leq C |x|^{2-n-2\sigma}$ for $0 \leq \sigma \leq m-1$ and $0 < |x| < 1$. This completes the proof Theorem [1.3](#page-1-5) when Φ is given by [\(3.2\)](#page-6-0).

Case II. Suppose Φ is given by [\(3.3\)](#page-6-0). Then $2 \le n \le 2m$ and n is even. To prove Theorem [1.3](#page-1-5) in Case II, it suffices to prove the following three statements.

(i) Estimate [\(1.12\)](#page-1-8) holds when $n = 2$, $\beta = 0$, and $m \ge 2$.

- (ii) Estimate [\(1.12\)](#page-1-8) holds when $|\beta| \leq 2m n 1$ and either $n \geq 3$ or $|\beta| \geq 1$.
- (iii) Estimate [\(1.11\)](#page-1-6) holds for $2m n \leq 2\sigma \leq 2m 2$.

Proof of (i). Suppose $n = 2$, $\beta = 0$, and $m \ge 2$. Then, since u is nonnegative, to prove (i) it suffices to prove

$$
u(x) \le C \log \frac{5}{|x|} \quad \text{for} \quad 0 < |x| < 1
$$

which holds if [\(4.4\)](#page-10-2) holds with $b = 0$ and $L^b = D^0 = id$. That is if

$$
-\Psi(x,y) \le C|y|^{2m-2} \log \frac{5}{|x|} \tag{4.8}
$$

By (3.4) , (4.5) , and (4.6) we have

$$
|\Psi(x,y) - \Phi(x - y)| \le \sum_{|\alpha| \le 2m - 3} |y|^{| \alpha|} |D^{\alpha} \Phi(x)|
$$

$$
\le C \sum_{|\alpha| \le 2m - 3} |y|^{| \alpha|} |x|^{2m - 2 - |\alpha|} \log \frac{5}{|x|} \le C|y|^{2m - 2} \log \frac{5}{|x|}
$$

and

$$
|\Phi(x - y)| = a|x - y|^{2m - 2} \log \frac{5}{|x - y|}
$$

$$
\leq C|y|^{2m - 2} \log \frac{5}{|y|} \leq C|y|^{2m - 2} \log \frac{5}{|x|}
$$

which imply (4.8) . This completes the proof of (i).

Proof of (ii). Suppose $|\beta| \leq 2m - n - 1$ and either $n \geq 3$ or $|\beta| \geq 1$. Then $n + |\beta| \geq 3$ and in order to prove (ii) it suffices to prove

$$
|D_x^{\beta}\Psi(x,y)| \le C|y|^{2m-2} \left| \frac{d^{|\beta|}}{d|x|^{|\beta|}} \Gamma_0(|x|) \right| \tag{4.9}
$$

because then [\(4.4\)](#page-10-2), and hence [\(4.3\)](#page-10-3), holds with $L^b = \pm D^{\beta}$.

Since Φ is given by [\(3.3\)](#page-6-0) we have $n \geq 2$ is even and

$$
\Phi(x) = P(x) \log \frac{5}{|x|}
$$

where $P(x) = a(-1)^{\frac{n}{2}} |x|^{2m-n}$ is a polynomial of degree $2m - n$. Since $D^{\beta}P$ is a polynomial of degree $2m - n - |\beta| \leq 2m - 3$ we have

$$
D_x^{\beta}P(x-y) = \sum_{|\alpha| \le 2m-3} \frac{(-y)^{\alpha}}{\alpha!} D^{\alpha+\beta} P(x). \tag{4.10}
$$

Since $D_x^{\beta} \Psi(x, y) = A_1 + A_2 + A_3$, where

$$
A_1 = D_x^{\beta} \Psi(x, y) - D_x^{\beta} \Phi(x - y) + (D_x^{\beta} P(x - y)) \log \frac{5}{|x|}
$$

\n
$$
A_2 = D_x^{\beta} \Phi(x - y) - (D_x^{\beta} P(x - y)) \log \frac{5}{|x - y|}
$$

\n
$$
A_3 = (D_x^{\beta} P(x - y)) \log \frac{|x|}{|x - y|},
$$

to prove [\(4.9\)](#page-12-1) it suffices to prove for $j = 1, 2, 3$ that

$$
|A_j| \le C|y|^{2m-2} \left| \frac{d^{|\beta|}}{d|x|^{|\beta|}} \Gamma_0(|x|) \right|.
$$
 (4.11)

Since

$$
\left| D^{\alpha+\beta} \Phi(x) - (D^{\alpha+\beta} P(x)) \log \frac{5}{|x|} \right| = \left| \sum_{\substack{\gamma \le \alpha+\beta \\ |\alpha+\beta-\gamma| \ge 1}} {\alpha+\beta \choose \gamma} (D^{\gamma} P(x)) \left(D^{\alpha+\beta-\gamma} \log \frac{5}{|x|} \right) \right|
$$

$$
\le C |x|^{2m-n-|\alpha|-|\beta|}
$$

it follows from [\(3.13\)](#page-7-9), [\(4.10\)](#page-12-2), and [\(4.5\)](#page-11-0) that

$$
|A_1| = |-A_1| = \left| \sum_{|\alpha| \le 2m-3} \frac{(-y)^{\alpha}}{\alpha!} D^{\alpha+\beta} \Phi(x) - \sum_{|\alpha| \le 2m-3} \frac{(-y)^{\alpha}}{\alpha!} (D^{\alpha+\beta} P(x)) \log \frac{5}{|x|} \right|
$$

$$
\le C \sum_{|\alpha| \le 2m-3} |y|^{|\alpha|} |x|^{2m-n-|\alpha|-|\beta|} \le C|y|^{2m-2} |x|^{2-n-|\beta|}
$$

$$
= C|y|^{2m-2} \left| \frac{d^{|\beta|}}{d|x|^{|\beta|}} \Gamma_0(|x|) \right|.
$$

Thus [\(4.11\)](#page-13-0) hold when $j = 1$.

Since $A_2 = 0$ when $\beta = 0$, we can assume for the proof of [\(4.11\)](#page-13-0) when $j = 2$ that $|\beta| \ge 1$. Then by (4.6) and (4.5) ,

$$
|A_2| = \left| \sum_{\substack{\alpha \leq \beta \\ |\beta - \alpha| \geq 1}} {\beta \choose \alpha} (D_x^{\alpha} P(x - y)) \left(D_x^{\beta - \alpha} \log \frac{5}{|x - y|} \right) \right|
$$

$$
\leq C |x - y|^{2m - n - |\beta|} \leq C |y|^{2m - n - |\beta|}
$$

$$
\leq C |y|^{2m - 2} |x|^{2 - n - |\beta|}
$$

$$
= C |y|^{2m - 2} \left| \frac{d^{|\beta|}}{d|x|^{|\beta|}} \Gamma_0(|x|) \right|.
$$

Thus [\(4.11\)](#page-13-0) holds when $j = 2$.

Finally we prove [\(4.11\)](#page-13-0) when $j = 3$. Let $d = 2m - n - |\beta|$. Then $1 \le d \le 2m - 3$,

$$
|A_3| \le C|x-y|^d \left| \log \frac{|x|}{|x-y|} \right|
$$

and by (4.5) and (4.6) we have

$$
|x-y|^d \left| \log \frac{|x|}{|x-y|} \right| \le \begin{cases} |x-y|^d \left(\frac{|x|}{|x-y|} \right)^d = |x|^d \le C|y|^{2m-2}|x|^{2-n-|\beta|} & \text{if } |x-y| \le |x| \\ |x-y|^d \left(\frac{|x-y|}{|x|} \right)^{2m-2-d} = |x-y|^{2m-2}|x|^{2-n-|\beta|} & \text{if } |x| \le |x-y| \\ \le C|y|^{2m-2}|x|^{2-n-|\beta|} = C|y|^{2m-2} \left| \frac{d^{|\beta|}}{d|x|^{|\beta|}} \Gamma_0(|x|) \right|. \end{cases}
$$

Thus [\(4.11\)](#page-13-0) holds when $j = 3$. This completes the proof of [\(4.9\)](#page-12-1) and hence of (ii). *Proof of (iii).* Suppose $2m - n \leq 2\sigma \leq 2m - 2$. In order to prove (iii) it suffices to prove

$$
(-1)^{m+\sigma+1} \Delta_x^{\sigma} \Psi(x, y) \le C|y|^{2m-2} \left| \frac{d^{2\sigma}}{d|x|^{2\sigma}} \Gamma_0(|x|) \right| \tag{4.12}
$$

because then [\(4.4\)](#page-10-2), and hence [\(4.3\)](#page-10-3), holds with $L^b = (-1)^{m+\sigma} \Delta^{\sigma}$ and $b = 2\sigma$. If $|\beta| = 2\sigma$ then [\(4.5\)](#page-11-0) implies

$$
\left| \sum_{1 \leq |\alpha| \leq 2m-3} \frac{(-y)^{\alpha}}{\alpha!} D^{\alpha+\beta} \Phi(x) \right| \leq C \sum_{1 \leq |\alpha| \leq 2m-3} |y|^{\alpha} |x|^{2m-n-|\alpha|-|\beta|} \leq C |y|^{2m-2} |x|^{2-n-|\beta|}.
$$

Thus it follows from [\(3.13\)](#page-7-9) that

$$
|\Delta_x^{\sigma}\Psi(x,y)-\Delta_x^{\sigma}\Phi(x-y)+\Delta^{\sigma}\Phi(x)|\leq C|y|^{2m-2}|x|^{2-n-2\sigma}.
$$

Hence to prove [\(4.12\)](#page-14-0) it suffices to prove

$$
(-1)^{m+\sigma+1}(\Delta_x^{\sigma}\Phi(x-y) - \Delta^{\sigma}\Phi(x)) \le C|y|^{2m-2}|x|^{2-n-2\sigma}.
$$
\n(4.13)

We divide the proof of [\(4.13\)](#page-14-1) into cases.

Case 1. Suppose $2 \le 2m - n + 2 \le 2σ \le 2m - 2$. Then by [\(4.5\)](#page-11-0)

$$
|\Delta^{\sigma}\Phi(x)| \le C|x|^{2m-n-2\sigma} \le C|y|^{2m-2}|x|^{2-n-2\sigma}
$$

and since

$$
\Delta^{\frac{2m-n}{2}}\left(|x|^{2m-n}\log\frac{5}{|x|}\right) = A\log\frac{5}{|x|} - B\tag{4.14}
$$

where $A > 0$ and $B \ge 0$ are constants, we have

$$
sgn((-1)^{m+\sigma+1}\Delta^{\sigma}\Phi(z)) = (-1)^{m+\sigma+\frac{n}{2}+1}(-1)^{\sigma-\frac{2m-n}{2}} = -1 \text{ for } |z| > 0.
$$

This proves [\(4.13\)](#page-14-1) and hence (iii) in Case 1.

Case 2. Suppose $2\sigma = 2m - n$. Then by [\(4.14\)](#page-14-2) and [\(4.6\)](#page-11-2) we have

$$
(-1)^{m+\sigma+1}(\Delta_x^{\sigma}\Phi(x-y) - \Delta^{\sigma}\Phi(x)) = (-1)^{\frac{n}{2}+m+\sigma+1}A\log\frac{|x|}{|x-y|}
$$

= $A\log\frac{|x-y|}{|x|} \le A\log\frac{3|y|}{|x|} \le A\left(\frac{3|y|}{|x|}\right)^{2m-2}$
= $A3^{2m-2}|y|^{2m-2}|x|^{2-n-2\sigma}$.

This proves (4.13) and hence (iii) in Case 2, and thereby completes the proof of Theorem [1.3.](#page-1-5) \Box

Proof of Theorem [1.4.](#page-2-0) Let $u(x)$ be defined in terms of $v(y)$ by [\(1.6\)](#page-1-9). Then by [\(1.7\)](#page-1-10) and [\(1.14\)](#page-2-4), $u(x)$ is a C^{2m} nonnegative solution of [\(1.10\)](#page-1-7), and hence $u(x)$ satisfies the conclusion of Theorem [1.3.](#page-1-5) It is a straight-forward exercise to show that [\(1.16\)](#page-2-5) follows from [\(1.12\)](#page-1-8) when $n < 2m$ and β satisfies [\(1.13\)](#page-1-3). So to complete the proof of Theorem [1.4](#page-2-0) we will now prove [\(1.15\)](#page-2-1).

Suppose $\sigma \leq m$ is a nonnegative integer. Let $v_{\sigma}(y)$ be the σ -Kelvin transform of $u(x)$. Then $v_{\sigma}(y) = |y|^{2\sigma - 2m} v(y)$ and thus by [\(1.11\)](#page-1-6), we have for $|y| > 1$ that

$$
(-1)^{m+\sigma} \Delta^{\sigma}(|y|^{2\sigma-2m} v(y)) = (-1)^{m+\sigma} \Delta^{\sigma} v_{\sigma}(y)
$$

$$
= (-1)^{m+\sigma} |x|^{n+2\sigma} \Delta^{\sigma} u(x)
$$

$$
\leq C |x|^{n+2\sigma} \left| \frac{d^{2\sigma}}{d|x|^{2\sigma}} \Gamma_0(|x|) \right|
$$

$$
\leq C \begin{cases} |x|^2 \log \frac{5}{|x|} & \text{if } \sigma = 0 \text{ and } n = 2\\ |x|^2 & \text{if } \sigma \geq 1 \text{ or } n \geq 3 \end{cases}
$$

which implies [\(1.15\)](#page-2-1) after replacing |x| with $1/|y|$.

Proof of Corollary [1.1.](#page-2-3) Theorem [1.4](#page-2-0) implies [\(1.17\)](#page-2-6) and

$$
-\Delta(|y|^{-2}v(y)) \le C|y|^{-2} \quad \text{for} \quad |y| > 1
$$

and thus for $|y| > 1$ we have

$$
-|y|^{-2}\Delta v(y) = -\Delta (|y|^{-2}v(y)) + (\Delta |y|^{-2})v(y) + 2\nabla |y|^{-2} \cdot \nabla v(y)
$$

\n
$$
\leq -\Delta (|y|^{-2}v(y)) + C \left(|y|^{-4}\Gamma_{\infty}(|y|) + |y|^{-3} \frac{d}{d|y|}\Gamma_{\infty}(|y|) \right)
$$

\n
$$
\leq C \begin{cases} |y|^{-2} & \text{if } n = 3\\ |y|^{-2} \log 5|y| & \text{if } n = 2 \end{cases}
$$

\n
$$
\leq C |y|^{-2} \left| \frac{d^2}{d|y|^2} \Gamma_{\infty}(|y|) \right|
$$

which implies [\(1.18\)](#page-2-7).

5 Proof of Theorem [1.1](#page-0-2)

As noted in the introduction, the sufficiency of condition (1.3) in Theorem [1.1](#page-0-2) and the estimate [\(1.4\)](#page-1-0) follow from Theorem [1.3,](#page-1-5) which we proved in the last section. Consequently, we can complete the proof of Theorem [1.1](#page-0-2) by proving the following proposition.

Proposition 5.1. Suppose $n \geq 2$ and $m \geq 1$ are integers such that [\(1.3\)](#page-0-3) does not hold. Let $\psi: (0,1) \to (0,\infty)$ be a continuous function. Then there exists a C^{∞} positive solution of

$$
-\Delta^m u \ge 0 \quad in \quad B_1(0) - \{0\} \subset \mathbb{R}^n \tag{5.1}
$$

such that

$$
u(x) \neq O(\psi(|x|)) \quad as \quad x \to 0. \tag{5.2}
$$

Proof. Let $\{x_j\}_{j=1}^{\infty} \subset \mathbb{R}^n - \{0\}$ be a sequence such that $4|x_{j+1}| < |x_j| < 1$. Choose $\alpha_j > 0$ such that

$$
\frac{\alpha_j}{\psi(x_j)} \to \infty \quad \text{as} \quad j \to \infty. \tag{5.3}
$$

Since [\(1.3\)](#page-0-3) does not hold, it follows from (3.1) – (3.3) that $\lim_{x\to 0} -\Phi(x) = \infty$ and $-\Phi(x) > 0$ for 0 < |x| < 5. Hence we can choose R_j ∈ (0, |x_j|/4) such that

$$
\int_{|z| < R_j} -\Phi(z) \, dz > R_j^n 2^j \alpha_j, \quad \text{for} \quad j = 1, 2, \dots \tag{5.4}
$$

Let $\varphi: \mathbb{R} \to [0,1]$ be a C^{∞} function such that $\varphi(t) = 1$ for $t \leq 1$ and $\varphi(t) = 0$ for $t \geq 2$. Define $f_j \in C_0^{\infty}(B_{\frac{|x_j|}{n}})$ $\frac{\sum_{j=1}^{c_j}(x_j)}{2}$ by

$$
f_j(x) = \frac{1}{2^j R_j^n} \varphi \left(\frac{|x - x_j|}{R_j} \right).
$$

Then the functions f_j have disjoint supports and

$$
\int_{\mathbb{R}^n} f_j(x) dx = \int_{|x-x_j| < 2R_j} f_j(x) dx \le \frac{C(n)}{2^j}.
$$

Thus $f := \sum^{\infty}$ $j=1$ $f_j \in L^1(\mathbb{R}^n) \cap C^\infty(\mathbb{R}^n - \{0\})$ and hence the function $u: B_1(0) - \{0\} \to \mathbb{R}$ defined by

$$
u(x) := \int\limits_{|y|<1} -\Phi(x-y)f(y) \, dy
$$

is a C^{∞} positive solution of [\(5.1\)](#page-15-0). Also

$$
u(x_j) \ge \int_{|y| < 1} -\Phi(x_j - y) f_j(y) \, dy
$$
\n
$$
\ge \frac{1}{2^j R_j^n} \int_{|x - x_j| < R_j} -\Phi(x_j - y) \, dy
$$
\n
$$
= \frac{1}{2^j R_j^n} \int_{|z| < R_j} -\Phi(z) \, dz > \alpha_j
$$

by (5.4) . Hence (5.3) implies that u satisfies (5.2) .
